***Title: From Stochastic Dominance to Polya Urns, Dirichlet Process and beyond: the Bayesian nonparametric passion.***

Abstract: Starting from the research inspired by my thesis on stochastic dominance, that I illustrated during the P65 workshop, I will now focus on further lines of research conducted under the supervision of Prof. Muliere and in collaboration with Dr. Stefano Peluso: an effort spanning three generations. The common theme is Bayesian nonparametric inference, one of Pietro's secret passions ... well, maybe not so secret after all!
